

5-4 Rational Functions

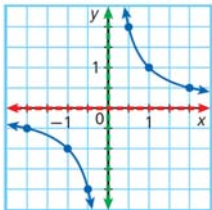

A **rational function**

The parent rational function is $f(x) = \frac{1}{x}$. Its graph is a *hyperbola*, which has two separate branches. You will learn more about hyperbolas later in this course.

5-4 Rational Functions

The function $f(x) = \frac{1}{x}$ has a vertical asymptote at $x = 0$ and a horizontal asymptote at $y = 0$.

5-4 Rational Functions

The rational function $f(x) = \frac{1}{x}$ can be transformed by using methods similar to those used to transform other types of functions.

$|a| \rightarrow$ vertical stretch or compression factor
 $a < 0 \rightarrow$ reflection across the x -axis

$k \rightarrow$ vertical translation
 down for $k < 0$; up for $k > 0$

$h \rightarrow$ horizontal translation
 left for $h < 0$; right for $h > 0$

$$f(x) = \frac{a}{x - h} + k$$

5-4 Rational Functions

Example 1: Transforming Rational Functions

Using the graph of $f(x) = \frac{1}{x}$ as a guide, describe the transformation and graph each function.

A. $g(x) = \frac{1}{x+2}$ B. $g(x) = \frac{1}{x} - 3$

5-4 Rational Functions

The values of h and k affect the locations of the asymptotes, the domain, and the range of rational functions whose graphs are hyperbolas.

5-4 Rational Functions

Example 2: Determining Properties of Hyperbolas
Identify the asymptotes, domain, and range of the function $g(x) = \frac{1}{x + 3} - 2$.

Vertical asymptote:
 Domain:
 Horizontal asymptote:
 Range:

Check Graph the function on a graphing calculator.

5-4 Rational Functions

The graphs of some rational functions are not hyperbolas. Consider the rational function $f(x) = \frac{(x-3)(x+2)}{x+1}$ and its graph.

The numerator of this function is 0 when $x = 3$ or $x = -2$. Therefore, the function has x -intercepts at -2 and 3 . The denominator of this function is 0 when $x = -1$. As a result, the graph of the function has a vertical asymptote at the line $x = -1$.

5-4 Rational Functions

Example 3: Graphing Rational Functions with Vertical Asymptotes

Identify the zeros and vertical asymptotes of $f(x) = \frac{(x^2 + 3x - 4)}{x + 3}$.

Step 1 Find the zeros and vertical asymptotes.

5-4 Rational Functions

Example 3 Continued

Identify the zeros and vertical asymptotes of $f(x) = \frac{(x^2 + 3x - 4)}{x + 3}$.

Step 2 Graph the function.
Plot the zeros and draw the asymptote. Then make a table of values to fill in missing points.

x							
y
